A: There are plenty of good ones available on the web - some are listed here: Conducting polymer-silicon nanocomposite as a potential counter electrode material for dye-sensitized solar cells. A conducting polymer, poly(3,4-ethylenedioxythiophene) (PEDOT), was used to fabricate a conductive composite with silicon by a layer-by-layer assembly method. The morphology and surface of the silicon nanoparticles in the PEDOT-silicon nanocomposite were investigated using scanning electron microscopy and Fourier transform infrared spectroscopy. Moreover, the electrochemical properties and interfacial conductivity were compared between the PEDOT-silicon nanocomposite and commercial carbon black. The PEDOT-silicon nanocomposite was applied as an alternative counter electrode material in dye-sensitized solar cells. It was found that the PEDOT-silicon nanocomposite displayed higher power conversion efficiency (7.64%) compared with that of the carbon black (6.45%). In addition, the conductivity of the PEDOT-silicon nanocomposite reached up to $1.10 \times 10(6)$ S m(-1).Rapid induction of apoptosis in human cancer cells by phytotoxins. Toxins derived from plants are the major
