Adobe Creative Suite Creative Suite, which makes up the CS products, has a variety of uses and themes. For the professionals in search of a mixture of all the tools mentioned in the previous two sections, it includes the best of the best. Figure 4-4 illustrates the version number design on the right. The image is in version CS6. The other two versions are for all products made by Adobe, including Macintosh and Linux versions. We're not going to deal with it here in this book.

One of the most popular features of Photoshop is the Liquify filter. Although the computer graphics community was missing this feature, some web designers wanted to use the same filter on content in motion. Now, thanks to a web tool called Photoshop Motion Presets, they don't need to make the edit in Photoshop, but an app called Photoshop Motion Presets for iPhone can be used instead of any other app to achieve the same result. An Overview of Photoshop Motion Presets Photoshop Motion Presets is an iPhone app that lets you create presets to use with the Liquify filter in Photoshop Motion. As you can see from the screenshot above, it's an easy app that allows you to create and save beautiful and personalized presets for the Liquify filter. The image above shows the original content, the image with the presets and the result after using the presets. It's very easy to use the presets in Photoshop Motion Presets. Once you open the app, you have to select an action to use as a starting point. Then you can add new filters and adjust their parameters. The app gives you the option to name each action created in the app. Once the preset is complete, you can save it and share it. The app also gives you the opportunity to buy additional packs of presets that will cost you $4.99 each. In order to create a new preset, the app first asks you to choose an image you want to edit. As

you can see in the image below, you can define a frame of your choosing in order to create a new preset, and then you need to select one or more actions to use to transform the original image. The last step is to apply all of the actions created in the new preset to the original content and save it as a new preset. Causes of gastric cancer: clues to etiology. We are just beginning to realize the role of the environment in the development of gastric cancer. Most of the gastric cancers of the diffuse type in Japan occur in people whose diets are rich in vegetables and seaweed, but usually low in fat. Studies of the changes in gastric mucosa in experimental animals suggest that repeated damage to mucosa by Helicobacter pylori, a common agent in the pathogenesis of diffuse-type gastric cancer, leads to a premalignant state and finally to cancer. It has also been found that many other infectious agents, such as hepatitis C virus

and herpes simplex virus, may play a role. Calcium salt intake and salt-containing foods appear to be other environmental factors involved. Efforts are under way to figure out more efficient ways of preventing gastric cancer.Modulation of transport through proton-selective ion channels in soybean root nodule cells. Recent work in our laboratory has demonstrated that, in soybean, nodule formation and nitrogen fixation are associated with the expression of Na+ and Cl- channels in root-nodule cells. Nodule formation also requires the upregulation of proton-selective ion channels, and the expression of these channels is dependent on the presence of bacteria in the nodules. The soybean root nodule is comprised of infected zone I and uninfected zone II cells. The initial rate of amine uptake through the Na+ channel, a marker for the host-cell plasma membrane, was found to be similar in both zone I and zone II cells. The initial rate of amine uptake through the Cl-channel, which is a marker for the symbiosomal membrane, is a slowly equilibrating process and its rate was greater in zone I cells than in zone II cells, suggesting that the plasma membrane of symbiosomal membrane is more permeable to amine in zone I cells. The initial rate of amine uptake through both channels did not vary with the presence of A. tumefaciens, which is not a symbiotic bacterium, nor with the presence of the autonomously replicating plasmid pRiA2. Analysis of

the amine influx data showed that, in the presence of sodium, the amine efflux rate was also insensitive to the presence of bacteria. However, the amine efflux rate in the presence of chloride was significantly decreased in the presence of bacteria. These data suggest that the
