This project is designed to run in a windowed environment, preferably on the desktop. It will start a server (if it does not already exist) with a web-based "server console" that will be used to view and control the server. The console will offer functions such as to select/start and stop the server, view the status of the server, view the log file and print a HTML "console" view that shows some text/data that will be displayed.

Compiling: This project does not compile by itself, since it is a server. You must use the Compile server server from the project manager to compile the class files into a server. Compile server: This project includes a server for you to compile. The server is

run when you click "Compile server" in the Project Manager. In this article we will discuss how to implement the Enterprise JavaBeans (EJB) container in the dynamic Web pages of the J2EE Web Application with the RCP framework. After you have decided to use the WebSphere Application Server 6.1.0, your next step is to install the WebSphere Application Server 6.1.0 platform as the EJB container in the application server. Before installing the web server and the application server, you need to perform the following tasks. 1. Download the web server and the application server, and the EJB container for WebSphere Application Server 6.1.0, and install them in different folders of your computer. For the recommended procedure, you can use the instruction provided in the guide "Installing WebSphere Application Server 6.1.0." in the section "Installing the Application Server." 2. In the path to the WebSphere Application Server 6.1.0 folder you want to use in this example, create the following folder structure, which will provide the following files to the WebSphere Application Server 6.1.0: Root |--installer |--help |--install |--servers

---

|--server1 |--server2 |--server2Library  
|--server2Library/lib |--server2Library/META-INF  
|--server2Library/server1.log  
|--server2Library/server2.log 3. On the command  
line, enter the following command to install the  
WebSphere Application Server 6.1.0 and the EJB  
container. The following illustration 77a5ca646e

Fusion 1.0 is a powerful and versatile HTML development environment. It allows you to develop Web pages, Web applications, database applications and database-driven web applications in Java. It allows you to develop programs using conventional Java, Java Applets, ActiveX Controls, AJAX and Swing interfaces and also JavaScript. It is based on the Java programming language, and therefore can be easily connected to other Java-based components, such as ActiveX controls and Java Applets. Fusion is the perfect environment for designing and developing a number of different Web, database and applet applications. The visual development tools include a comprehensive set of dialog boxes, a rich graphics editor and a preview pane that enables you to preview the final output of the application. It also provides a number of tools for importing and exporting data between applications and databases. To achieve this, Fusion uses a number of Java technologies, including Swing, an object-oriented

Q: How can I find out the version of a Git repository? How can I find out the version of a Git repository? To be more precise, I have a project for which we use Git. We want to compare the versions with a second project. I know that these are two different repositories, but I don't know what command I can use to get the version of the first repository.

A: The git shortlog command can do this. Short log is what you want. Given a repository name: `git shortlog -s --no-merges master`

Output: 10ac4f7 Aaron Ruttenberg, Aaron Ruttenberg 12a6a49 Aaron Ruttenberg, Aaron
