Photoshop is a powerful tool that enables a photographer to create many types of images, such as retouching, compositing, and selective bleaching. Chapter 14 covers these and other retouching options in this chapter, whereas Chapter 16 covers compositing techniques. Although the retouching brush is a great tool, it's not without its shortcomings. In particular, the retouching brush can sometimes go haywire if you don't understand how to apply it correctly. Chapter 16 covers all of the possible techniques and pitfalls for editing your images. Photoshop also enables you to produce some really amazing images. Many photographers use Photoshop to re-create images that are lost or have been damaged. One of my Photoshop friends makes altered images from images of old icons, pre-1900s, using layered masks. Some of the images can look like they were created in the 1940s or earlier, but they're all created by using Photoshop's powerful tools. Recovering Images Photoshop is very capable of recovering images from multiple sources. Relying on multiple sources is an important practice when working with many gigabytes of image files. If a camera has just recorded an image that's been erased or corrupted, the help of Photoshop can come in handy by allowing you to recover it. You can recover files from your camera and computer. In general, the camera and computer are the first places to look for your lost images, but you can also look in your trash. If you've deleted an image by accident, the trash has a number of potential sources for this misplaced image. I've recovered images of all sorts from the trash folder. Here are a few tips on how to retrieve images from your camera and your computer: Use your camera's self-diagnostic tools and follow the on-screen instructions. Most camera brands provide a self-diagnostic on their website with further information. These tools will generally tell you how many images are stored on your memory card, and whether you need to clean, format, or replenish it. Your camera

Selective synthesis of polyhydroxyalkyl starch-based cellulose esters. A convenient method was developed for the synthesis of esters from polyhydroxyalkyl starch (PHAS) with desired molar substitution of 0.2 to 1.0 by means of an in situ acylation reaction using acetic anhydride. The synthesized cellulose esters were characterized by FT-IR, (1)H NMR, (13)C NMR, elemental analysis, and X-ray diffraction. Their thermal properties were studied by using thermal gravimetry (TG), differential scanning calorimetry (DSC), and thermogravimetry analysis (TGA). The results showed that these cellulose esters were formed as a result of an in situ acylation of polyhydroxyalkyl starch (PHAS) and have an orthorhombic crystal structure. The amount of acetic anhydride used was 10% of the total mass of the reactants. The amount of anhydride used significantly increased the molar substitution of cellulose esters. The existence of hydroxyl groups of the esters was determined by (1)H NMR. The prepared cellulose esters were thermostable up to 400 degrees C and show no degradation or thermal decomposition up to 300 degrees C. Tuesday, June 4, 2010 Use Away! I'm sorry for being MIA. My computer has had a bit of an issue and at first I thought it was just a software problem. I took it in to the good service people at OfficeMax. They were kind enough to try and fix it. It did not work. They tried it 4 more times. So I called Microsoft customer service and they were ready to walk me through setting it up again. I did this and it still didn't work. So I asked them to just to the restoration process. They said "you can not do that". They said it will take 3 days to restore it. So, I asked if I would have to buy a new computer. They said yes. I asked if they could do it over the phone and they said, "no". So, today I am walking back to my retail store with a nice shiny new computer. I can't wait to take off my old one. I have been an avid blogger and I'm sure that I will have tons to share. So, stay tuned. About Me I am a grandma

What is the difference between Bioconductor packages and R packages? Are they the same thing? If they are the same thing, why does Bioconductor use R packages and not create Bioconductor packages? A: Bioconductor packages are repositories of functions. They are as such mostly based on R packages but some of them, such as those related to plotting tools, base packages, are unique to Bioconductor. R packages are collections of code that can be used in an R project. They are more like libraries than packages. Because R packages are not Bioconductor packages but are intended to be used in Bioconductor projects they are generally not tagged with the biocro:: or similar terms that are used for Bioconductor packages. A: Bioconductor packages are not used for R or its main packages but only for some of their internal or external dependencies.
