Effect of fecal microflora on intestinal bacterial growth in the pig. The effect of the fecal microflora on the growth of intestinal bacteria was investigated. Three animals were housed individually in steel metabolic cages and fed diets free of added antibiotics. Fecal samples were collected and transferred to media containing glucose or galactose. Growth of populations of enterobacteria, lactobacilli, and enterococci was determined by plate counts. Growth of enterobacteria, lactobacilli, and enterococci in culture containing fecal microflora was inhibited in a dose-related manner. This inhibition was due to the growth of enterococci rather than lactobacilli or enterobacteria. Addition of stool from other pigs fed a diet free of antibiotics to fecal cultures did not further inhibit growth of enterobacteria, lactobacilli, or enterococci. In vitro growth was inhibited by fecal microflora from gnotobiotic pigs as well as pigs fed diets free of antibiotics. It was concluded that the effects of fecal microflora on the growth of bacteria are strain specific and that the growth of a given bacterium is not inhibited by other gut microorganisms.
