A: Xcodeproj is a framework that is used to develop apps for OS X. As stated in the documentation: "Xcode does not support iOS apps development". "Xcode is the developer's workbench for writing, testing, debugging, packaging, uploading and running Xcode-generated apps on OS X. Xcode runs on a Mac OS X computer. Apple will not support Xcode on any computer or operating system other than Mac OS X." Also related to your issue, but it's not a duplicate: How to create cross-platform Xcode project? Q: when to use foreach and the typeof operator I have a javascript array of objects. I want to manipulate this array to change the position of the objects. I have searched for how to do this and have found people having used "for each", or the "for" operator. I have also seen people having used the "typeof" operator. So I am not sure, which one to use. Which one is better to use, which of the 2 is more safe, and which of the 2 is more preferred? A: The typeof and for loops are not the same. Type of evaluates the object type. for loops uses to iterate over a collection. Here is a comparison. for (var i = 0; i
