If you're reading this and the game isn't working, make sure to fill out the form below.The present invention relates to the rolling of sheet material. In particular, the present invention relates to a method for rolling a workpiece that includes the forming of a plurality of annular seal zones along the periphery of the workpiece. Annular seals, such as exhaust valve seals, are often fabricated on workpieces, such as valves, by a precision centering process. This process creates a ring-shaped circumferential seal having a diameter that is slightly smaller than the diameter of a cylindrically shaped exhaust valve. This circumferential ring-shaped seal is then positioned about the exhaust valve and the two parts are welded together. A problem with this process is that the welding process may distort the ring-shaped seal and change the radius at which the seal is located on the valve. In addition, the weld itself may introduce distortions into the ring-shaped seal. The distortion introduced into the ring-shaped seal by welding may also change the radius of the seal. This is particularly true in the case of valve seals wherein it is necessary to maintain the smaller diameter of the ring-shaped seal to permit a proper seal function. If the seal is not properly located, then, in the case of a valve seal, the margin at which the seal will seal the valve is dramatically reduced and further increases the likelihood that fluid, such as combustion gas, will leak past the seal. In addition, the weld process is relatively slow, which increases the unit cost of fabricating the ring-shaped seal. Also, the fact that the weld material is introduced between the portion of the ring-shaped seal that contacts the workpiece and the portion of the ring-shaped seal that extends beyond the workpiece reduces the strength of the seal along the line of welding. The weaker seal that is formed between the portion of the ring-shaped seal that contacts the workpiece and the portion of the ring-

07 Dec 2018 04:26:04 +0000>Q: One-to-many relationship with Linq Here is my problem, I have two tables, Comments and CommentsToUsers.

CommentsToUsers has one-to-many relationship with Comments. Comments.Title is set as Primary Key in Comments table. And I want to give result from that table (maybe using LINQ). Can anyone write me the code? What I tried is this but it can't work. A: Maybe you meant var comments = db.Comments.Where(x => x.CommentsToUsers.Any(y => y.UserId == someUserId)); if so, then var comments = db.Comments.Where(x => CommentsToUsers.Any(y => y.UserId == someUserId)); var result = new List(); foreach (var c in comments) { result.Add(c); } Problems with the definition of "quality" in public health and health promotion science. This article aims at clarifying the meaning and influence of the underlying assumptions upon which "quality in health care" has been constructed. The conceptual basis of quality in healthcare is presented as derived from the framework provided by quality theory in the literature. This analysis reveals how key concepts in the quality literature have been used in an ideological manner in ways that reconfigure (or reestablish) "the world". It is argued that "quality" has a secret history, both in medicine and political ideology.Q:
