What's New In?

MultiPad is a special tool that allows you to work on multiple documents simultaneously and offers a whole set of options to customize your workspace in any way you want. It's perfect for those who

prefer to use their PC at the same time for different tasks, be they work related or personal. Screenshots: Field of the Invention The present invention relates to a method for producing a rolled metal material having high formability, high product yield and low production cost. 2. Description of Related Art In general, a cast iron contains an alloying element such as silicon or aluminum, which makes the cast iron have a high hardness and good wear resistance, and thus it is used as a metal mold or a metal roll. However, the above cast iron is extremely difficult to produce in a roll form by casting, because there is a limit to the casting process. Therefore, the above cast iron is generally formed in the form of a metal mold by pressing and cutting. On the other hand, a cold-rolled steel sheet is produced by rolling a hot-rolled steel sheet which is supplied from a hot-rolling furnace at a high temperature of about 900.degree. C. However, the above cold-rolled steel sheet generally has a poor formability, and cannot be applied to a thin-walled structure, a thin plate-like structure and the like, which are required to the cast iron, so that it is limited to use as an exterior material. When the above cold-rolled steel sheet is applied to a thin-walled structure, a thin plate-like structure and the like, it is deformed to be a thin wavy shape and is used in a thin-walled structure, a thin plate-like structure and the like. Although the cold-rolled steel sheet is excellent in workability and corrosion resistance and has a high formability, the cold-rolled steel sheet has a large amount of alloying elements and is heavy and is hard to work, so that it is very difficult to apply the cold-rolled steel sheet to a thin-walled structure, a thin plate-like structure and the like. Therefore, it is limited to use as an exterior material. An annealed sheet having a high strength is produced from a hot-rolled steel sheet by annealing, and it is applied to an exterior material for a vehicle, a jet engine and the like, or a general building structure. However, although the annealed sheet has a high strength, it has an excessively high hardness and is hard to work, and thus it is difficult to work the annealed sheet. Therefore, it is limited to use as an exterior material for a vehicle, a jet engine and the like, or a general building structure. It is known that
