I have been using Adobe Photoshop since I bought it back in 1992 when it first came out. It always supported both Mac and Windows systems, so I did not pay much attention to system requirements, but it was built on Mac, and I wanted to stay with a Mac. I've used Photoshop on both Mac and Windows, and it seemed to work fine on both. The hardware requirements list was thin. The main things that you needed was an Intel processor and at least 512 MB of RAM. I tried Photoshop CS3 and found the interface to be quite difficult to figure out. Throughout the hundreds of hours I spent tweaking and experimenting to get the best performance and the best image editing experience, I quickly found out that Photoshop could be a powerful image editor. Adobe has made a remarkable improvement to their software with version CS 4 and CS 5, but I have serious reservations about the performance improvements in the new version. The thought of doing multiple editing tasks in Photoshop would put a serious hit on your CPU and RAM. I upgraded to the five version a couple of years back, because the interface was becoming fairly slow. I've been using it for fifteen years, so I'm not really all that familiar with the new layout. I like it, but I remember always having to fight with Photoshop when I used it back in the early 2000s. If what you really want is a fast way to edit, you may be better off staying with Photoshop Elements. The brand new version of Photoshop is the return of the old interface, but with good performance.
